Markerboards complement design of new Athletic Academic Center

Markerboards created for this newly constructed academic center reflect the attractive design of the learning environment. The boards were designed using satin anodized aluminum with a high profile trim. The trim profile offers a writing surface that's recessed from the aluminum trim surface, creating a shadow box type design. The marker writing surface is a porcelain enameled steel laminated to a half-inch MDF substrate.

These factory-built boards were shipped in two sections and joined on the job site to produce 24 linear feet (and 96 square feet) of writing surface.
